

Dear Techedify PH Hiring Team,

I'm applying for your Software Developer role supporting your Generative AI-powered EdTech platform. I'm a full-stack developer based in Manila (UTC+8) who works independently, takes ownership of platform issues end-to-end, and builds daily with AI-assisted "vibe coding" tools — which maps closely to how your team works with Project Managers and Lead Developers in California.

Taking ownership of escalated platform issues is what I do now. At DOST-ASTI I maintained production web services, resolved issues through root-cause analysis with minimal supervision, and raised unit-test coverage from 0 to ~90% to keep the system maintainable. I work across both server- and client-side JavaScript, have hands-on production experience with PostgreSQL and REST/API integrations, and have built MVC web applications (Ruby on Rails) front to back. I'm comfortable participating in code reviews, writing tests, and keeping documentation current — habits I carry into every project.

Your emphasis on Generative AI and AI-assisted development is a strong fit. I built Aqualytix, a production water-monitoring platform, solo and end-to-end using Claude Code as a pair-programmer while owning every architecture and data-modeling decision — exactly the kind of human-led "vibe coding" your products encourage. I also built an AI-as-a-Service platform at DOST-ASTI that standardized how AI/ML models are deployed and exposed as consumable APIs, cutting integration time from months to days. I'm genuinely interested in AI, education technology, and emerging developer tools.

I'm a self-driven, async-friendly communicator who is comfortable on a fixed US-aligned shift, and I'd welcome the mentorship and growth path you describe. I'd love to discuss how I can help support and extend your platform. Thank you for your consideration.

Sincerely, Joseph Karl Crisostomo
